

Nash Technologies Starts Running Its Own V93000

Nash Technologies celebrates the successful installation of their own V93000 tester

Böblingen, May 2nd, 2023. Few days after delivery, Nash Technologies installed its own V93000 tester from Advantest, an advanced chip testing system which is now fully operational in our labs. The sophisticated system has four test heads and weights 840 kg. It is the most developed tester that Advantest has on the market since 1999. This enables us to run customer projects completely independently. It also reinforces our commitment to grow in the semiconductor testing business and become the first address in this outstanding technology in Europe.

“Our own tester arrives just in time before the next expected season of growth in the semiconductor industry”, says Georg Pielage, CEO of Nash Technologies Germany GmbH, “we are very proud to be able to further develop the quality and the volume of our services in this thriving industry.”

The festive cake of our celebration party must not to be left unmentioned: it was a creation of a local patisserie and hardly distinguishable from the real V93000.
